

An aerial photograph showing a coastal landscape. A large body of water, likely a lake or sea, is visible in the upper portion of the frame, with its deep blue color contrasting against the surrounding land. The land consists of green fields and patches of brown, possibly indicating agricultural areas or natural vegetation. In the lower right foreground, there is a prominent, dark green, hilly area that appears to be a forested mountain or hillside. The overall scene is a mix of natural and possibly human-influenced environments.

From their first commercial use in the 1920s, it is estimated that over 1,500,000 tons (1.5×10^{21} ng) of PCBs were produced worldwide. PCBs were banned from production in most countries in the 1970s, though large-scale contamination of the environment remains a problem today. In 2001, PCBs were included in the original Stockholm Convention list of Persistent Organic Pollutants.

Unlabeled “Certified” PCB Standards

While CIL's primary business is isotopically labeled standards, it is important to remember that the accuracy and precision of a quantitative analysis is dependent upon the accuracy and precision of the unlabeled (native) standards. In the past, CIL utilized commercially available native standards from multiple vendors for the confirmation of our isotopically labeled standards. It was discovered, however, that there can be substantial variability among the commercial native standards. Thus CIL initiated the “Certified” PCB standards program. CIL prepares native “Certified” standards using good laboratory practice (GLP). Individual, native, crystalline PCB isomers (98%+ purity) are weighed in triplicate on a microbalance calibrated with NIST traceable Class S weights, and formulated to specific concentration. Triplicate analyses of each of the three solutions in isoctane are carried out using GC/MS. In order to establish statistical control, the relative standard deviation (RSD) of each solution must be less than 5%, and the RSD for the entire set of analyses for all three standards must be <5%. When these parameters have been met, the solutions are combined and the resulting solution analyzed again in triplicate by three chemists. If the RSD of these analyses is also <5%, the final product is the “Certified” PCB standard. These 100 µg/mL solutions are highly accurate native standards for quantitation of PCBs. These standards are used in all CIL calibration series and native standard mixtures, and are used to validate all isotope labeled standards from CIL.

Isotope Labeled PCB Standards

CIL now offers more than 50 individual ¹³C-labeled PCB standards to meet the growing needs of researchers utilizing Isotope Dilution MS. All ¹³C-labeled PCB standards are quantified against CIL “Certified” unlabeled PCB standards for utmost precision and accuracy.

In addition to the “Dioxin-Like” (DL) congeners designated by the WHO, CIL also offers standards for the “non-Dioxin-Like” or “Marker” PCB congeners found in commercial mixtures, as well as a host of other ¹³C-labeled PCB standards used for specialized purposes.

NEW “High Purity” PCB Standards

For more than 20 years CIL has been a pioneer in developing high quality PCB standards, introducing the first ¹³C-labeled PCBs used in the earliest IDMS methods, and more recently developing the first PCB standards formulated under the “Certified Standards” protocol.

CIL is once again responding to the needs of the analytical community by providing High Purity PCB standards. As new instrumentation and methodologies drive detection limits lower, the presence of even very low levels of impurities in the labeled standards of other PCB congeners or polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/Fs), become a hindrance to the laboratories minimum detection capabilities.

Chemical Identity: Unambiguous identity by GC/MS, ¹H-NMR, ¹³C-NMR, and MP determination

Isotopic Enrichment: 99% by GC/MS

Chemical Purity: >98% by GC/MS, GC/ECD, and ¹H-NMR

- Native Content: <0.1% by GC/MS SI

- ¹³C-non-ortho DL-PCBs: <0.05% by GC/ECD vs. cal-curve, or HRGC/MS

- 17 (2,3,7,8) Containing PCDD/Fs: <0.05% for each compound by HRGC/MS

Concentration: 40 ± 2 µg/mL by comparison assay vs. native “Certified Standard”

Uncertainty: Conforming to Eurachem/CITAC Guide
“Quantifying Uncertainty in Analytical Measurement”

CIL has developed aggressive cleanup procedures, and adopted much tighter quality control specifications for the eight mono-ortho substituted “dioxin-like” PCBs (DL-PCBs). These new specifications include extremely low allowances for ¹³C-non-ortho DL-PCBs, native content, other PCB congeners and PCDD/Fs.

CEN Method EN-1948-4 PCB Standard Mixtures

In 2006, CIL collaborated with the CEN (European Committee for Standardization) organizing laboratory to develop and define PCB Calibration series and ¹³C₁₂-labeled spiking solutions to be used with method CEN/TS 1948-4. CIL supplied these standards to the organizing laboratory for use in their Interlaboratory Evaluation Study, and now these same standards are available to you from CIL.

NEW Comprehensive Native PCB Mixtures

CIL has produced two large mixes of unlabeled PCBs, formulated entirely from CIL's PCB “Certified Standards” individual stock solutions. The Comprehensive Native PCB Mixture is a multipurpose mixture that includes all the WHO Dioxin-Like PCBs that have been assigned TEFs, the predominant congeners, and first- and last-eluting congeners from the Mono through Deca homologue groups. Since some pairs of these compounds coelute on certain columns, the Fully Resolved Native Mono-Deca PCB Mixture was formulated with no coeluting congeners under normal analytical conditions.

Unlabeled PCB Standards

CIL also offers:

- all 209 PCBs in single-weighed solutions at approximately 35 µg/mL in Isooctane, with chemical purity >95%.
- all 209 PCBs in neat form; typically at nominal weights of 1 or 5 mg.

Please consult the CIL website at www.isotope.com for details, and search for the PCB number in the Catalog Number field.

Unlabeled Methyl Sulfone PCB Standards

Methyl Sulfone derivatives of polychlorinated biphenyls (MeSO₂-PCBs) are known to be primary metabolic products of PCBs. These are persistent, lipophilic compounds which accumulate in the lung, liver and kidney tissues of mammals exposed to PCBs.
