Particle technology

YMC-Triart is a versatile material prepared using tightly controlled particle formation technology which has been adapted from micro-reactor technology. This recently developed production process developed by YMC results in exceptionally narrow particle and pore size distributions.

With YMC-Triart, challenging pH and high temperature conditions are no longer a limitation to the day-to-day work in laboratories. Most importantly, due to its unique particle composition, a balanced hydrophobicity and silanol activity are achieved which makes YMC-Triart a "First Choice" column in method development.

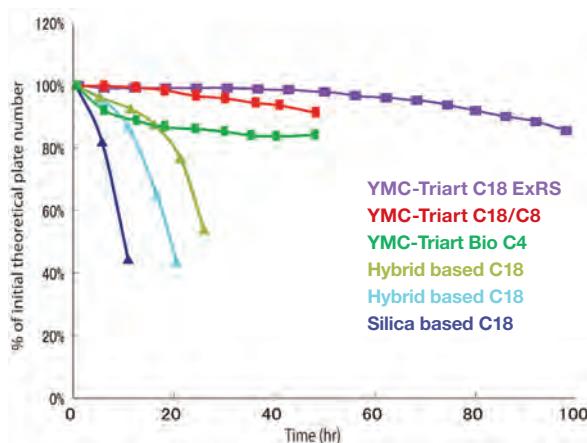

"First choice" column for method development

pH & temperature

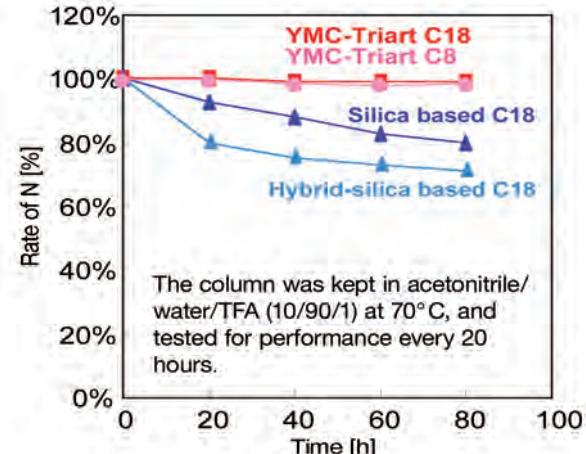

Versatile wide pH stability

Phosphate buffer (pH 11.5, 40 °C)

Column: YMC-Triart (5 µm) 150 x 4.6 mm ID
 Part No.: TA12S05-1546PTH
 Eluent: 50 mM K₂HPO₄-K₃PO₄ (pH 11.5) / methanol (90/10)
 Flow rate: 1.0 mL/min
 Temperature: 40 °C
 Sample: benzyl alcohol

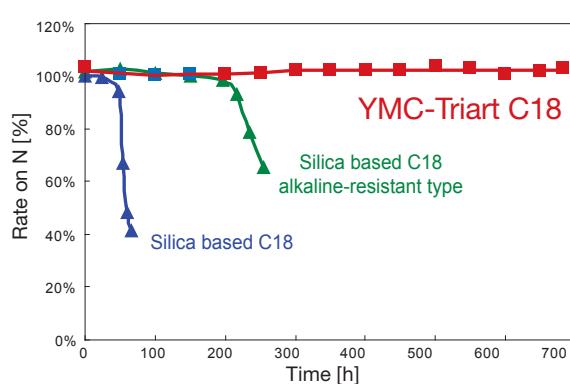

1% TFA (pH 1, 70 °C)

Column: YMC-Triart C18 (5 µm) 50 x 2.0 mm ID
 Part No.: TA12S05-0502WT
 Eluent: acetonitrile / water (60/40)
 Flow rate: 0.2 mL/min
 Temperature: 37 °C
 Sample: butyl benzoate

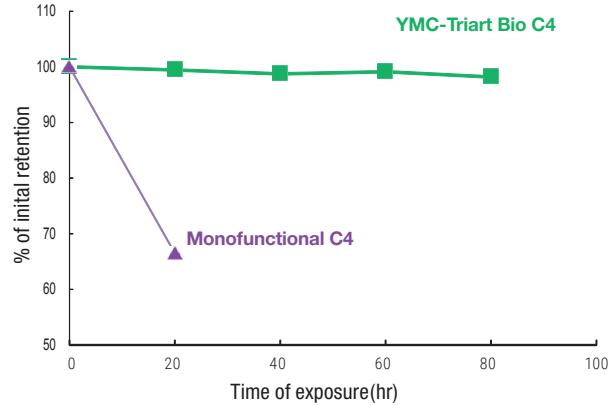

Stability at high temperature

pH 6.9, 70 °C

Column: YMC-Triart C18 (5 µm) 50 x 2.0 mm ID
 Part No.: TA12S05-0502WT
 Eluent: 20 mM KH₂PO₄-K₂HPO₄ (pH 6.9) / acetonitrile (90/10)
 Flow rate: 0.2 mL/min
 Temperature: 70 °C
 Sample: phenol

pH 1, 90 °C

Column: YMC-Triart Bio C4 Column (5 µm) 150 x 3.0 mm ID
 Part No.: TB30S05-1503PTH
 Eluent: acetonitrile/water (60/40)
 Flow rate: 0.4 mL/min
 Temperature: 37 °C
 Sample: butyl benzoate

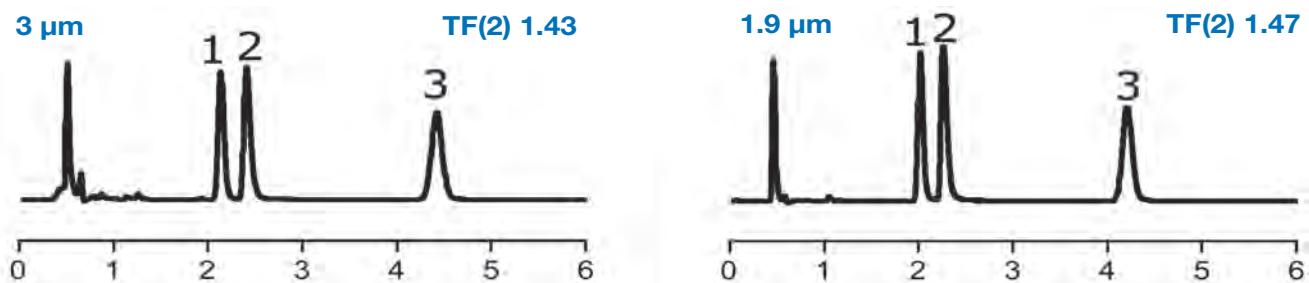

YMC-Triart phases show great chemical stability due to the highly developed hybrid-silica matrix. Even under high pH or high temperature conditions, the lifetime of YMC-Triart phases is more than 10 x greater than conventional reversed phase columns.

Transfer HPLC↔UHPLC

Secure your method transfer!

Differences in selectivity, retention time, and also peak shapes between different particle sizes of commercially available C18 phases in the same brand (or an alternative as recommended by its manufacturer) have been observed.

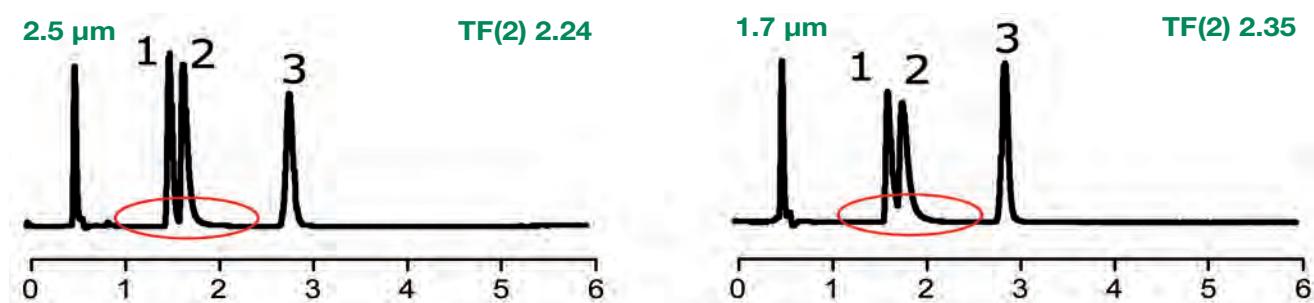

YMC-Triart C18

YMC has addressed this issue of method transfer. YMC-Triart columns show identical selectivity and excellent peak shapes for basic compounds for all 3.0 µm to 1.9 µm particle sizes. It allows predictable scale up from UHPLC to conventional HPLC and even to semi-preparative LC, and vice versa.

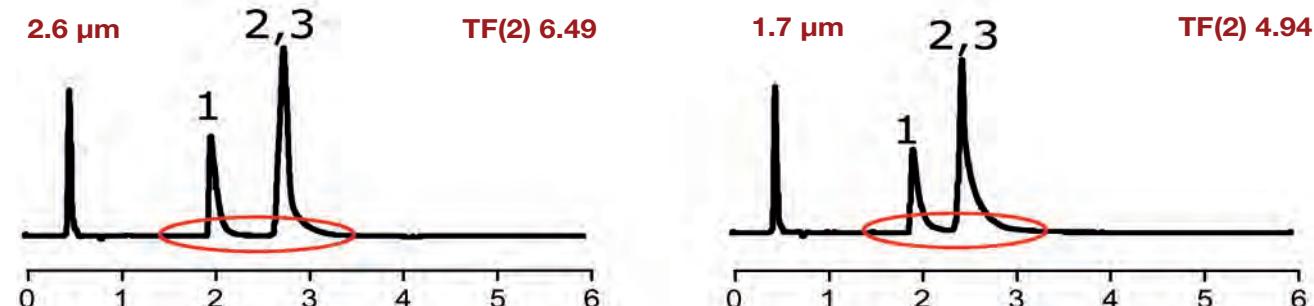

Case Studies

X-Bridge BEH C18 and Acquity UPLC BEH C18

** These observations might not be representative for all applications.

Kinetex™ C18

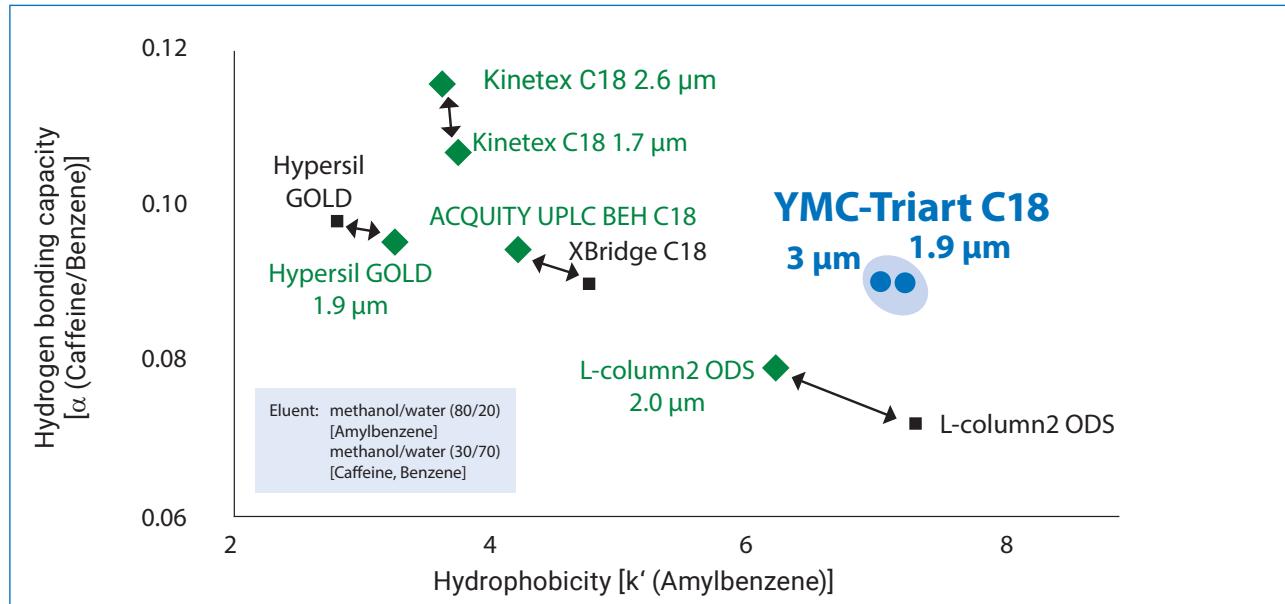

Kinetex™ C18 columns show significant peak tailing and have limited scalability due to lack of larger particle sizes.

Column:	50 x 2.0 mm ID or 2.1 mm ID
Eluent:	20 mM KH ₂ PO ₄ -K ₂ HPO ₄ (pH 6.9) / acetonitrile (65/35)
Temperature:	40 °C
Flow rate:	0.2 mL/min
Detection:	UV at 235 nm

- 1. Chlorpheniramine (basic)
- 2. Dextromethorphan (basic)
- 3. Propyl paraben (internal standard)

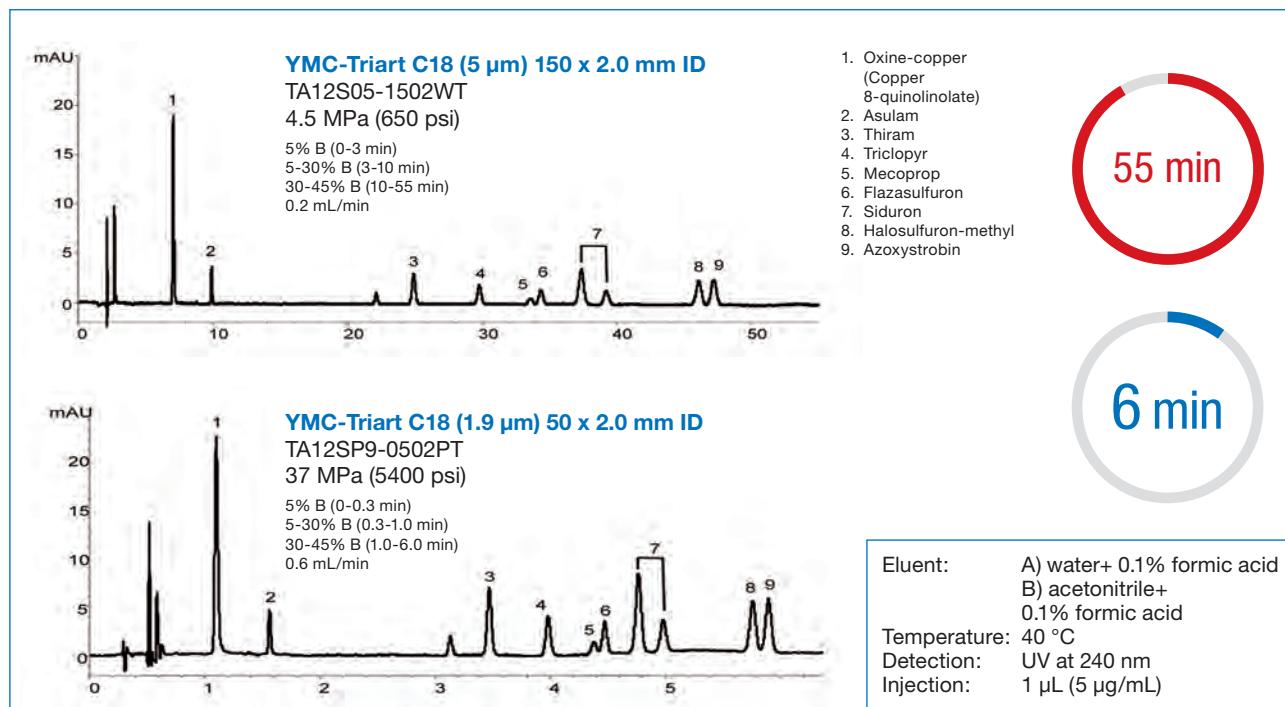

Transfer HPLC↔UHPLC

Evaluation of method transfer performance!

With the introduction of UHPLC, sub-2- μ m particles became necessary. Therefore smaller particles have been added to existing column lines. Consequently, sub-2- μ m particles may exhibit differences in chromatographic performance. By introducing YMC-Triart, YMC provides matching chromatographic behaviour for all particle sizes!

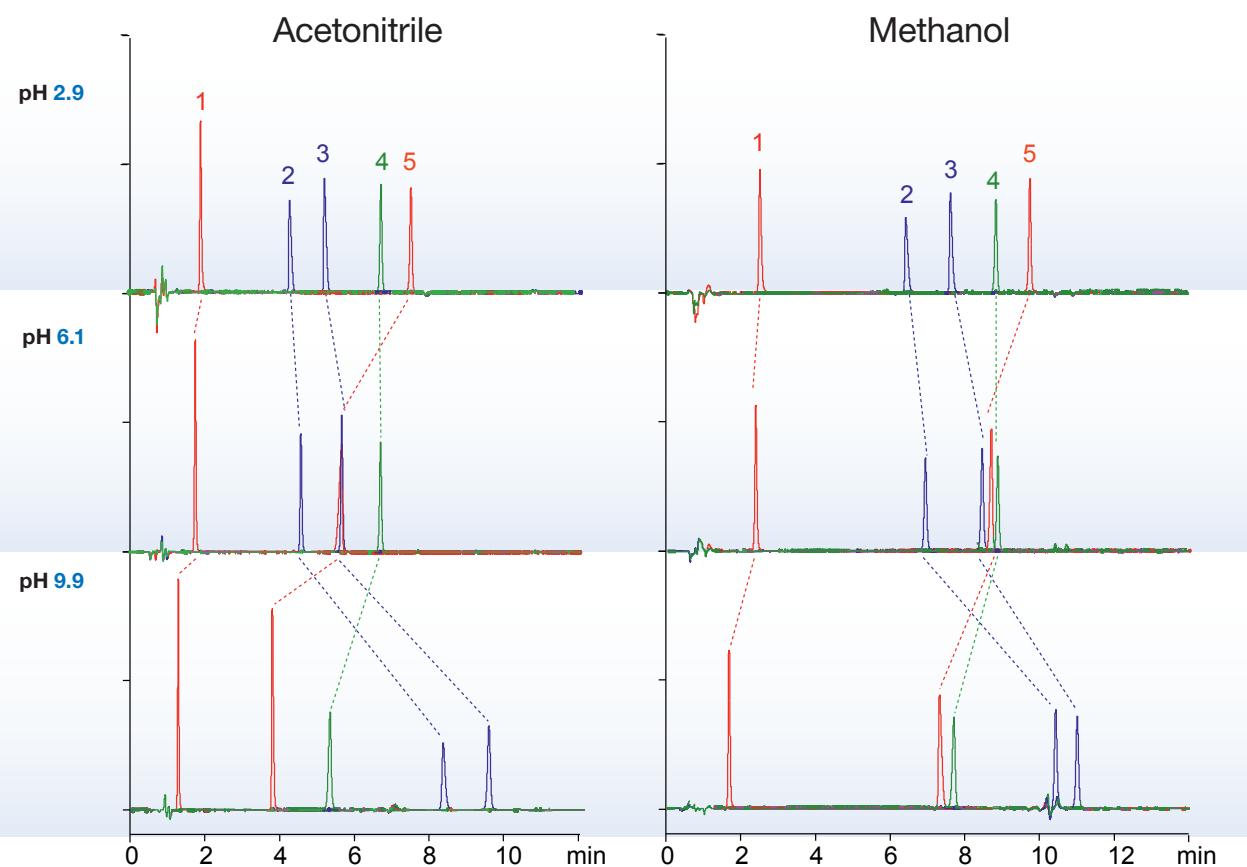

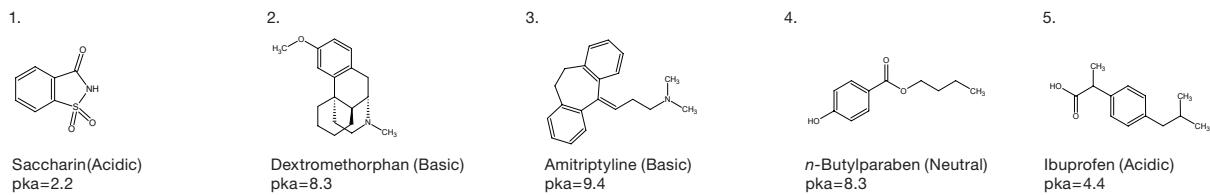

Method transfer HPLC↔UHPLC

When transferring the 55 min HPLC method to UHPLC scale, the resolution remains the same although the separation time is reduced to only 6 min.

pH flexibility

Combination of pH and organic solvent

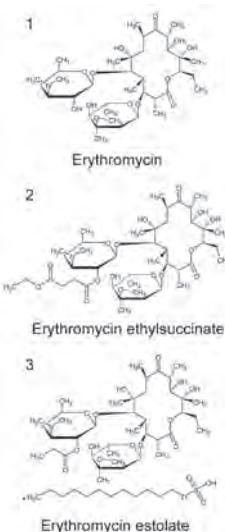

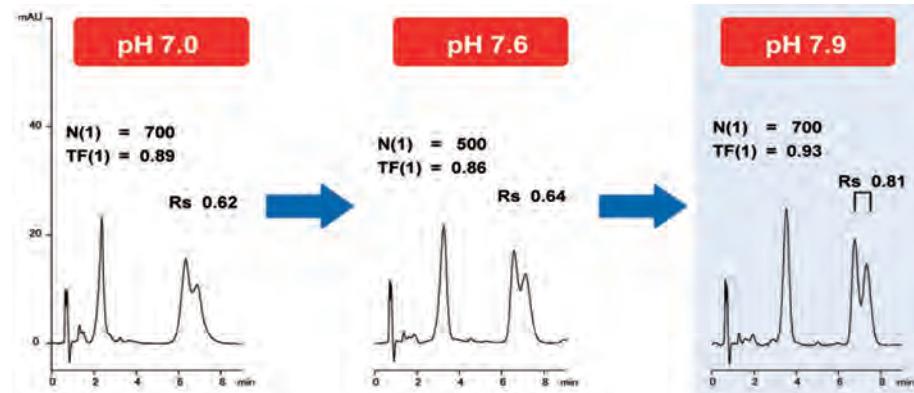

Column: YMC-Triart C18 (5 µm, 12 nm) 50 x 2.0 mm ID
 Part No.: TA12S05-0502WT
 Eluent: A) 10 mM HCOOH for pH 2.9
 10 mM HCOONH₄ for pH 6.1
 10 mM HCOONH₄-NH₃ for pH 9.9
 B) organic solvent
 Gradient: 5-90% B (0-10 min), 90%-B (10-15 min)
 Flow rate: 0.2 mL/min
 Temperature: 25 °C
 Detection: UV at 230 nm

In reversed phase HPLC, pH and organic solvent are the most important factors to control retention and selectivity. YMC-Triart C18 with its wide range of usable pH offers significant advantage in selection of mobile phase conditions. YMC-Triart C18 delivers symmetrical peak shapes for all types of compounds irrespective of the pH and composition of the mobile phase. Chromatographers can select the optimal condition by combining various mobile phase parameters such as mobile phase pH, and type of organic solvent or buffer system.

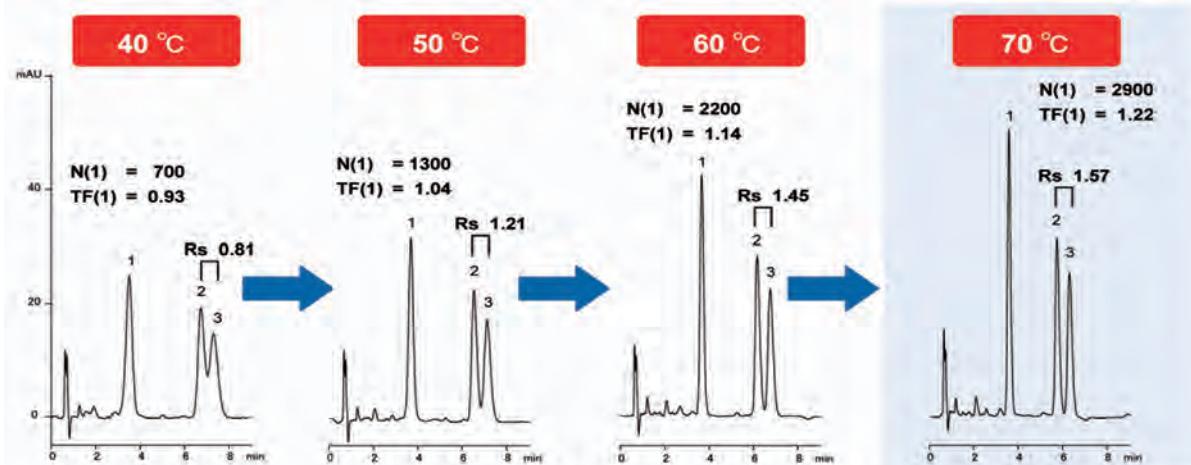

Temperature flexibility

Erythromycin at elevated pH and temperature

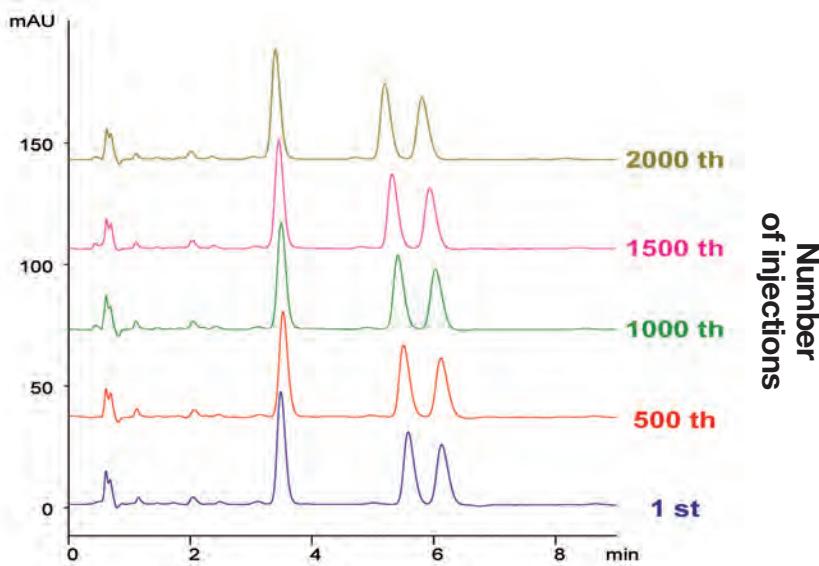

1. Optimisation of pH

2. Optimisation of temperature (pH 7.9)

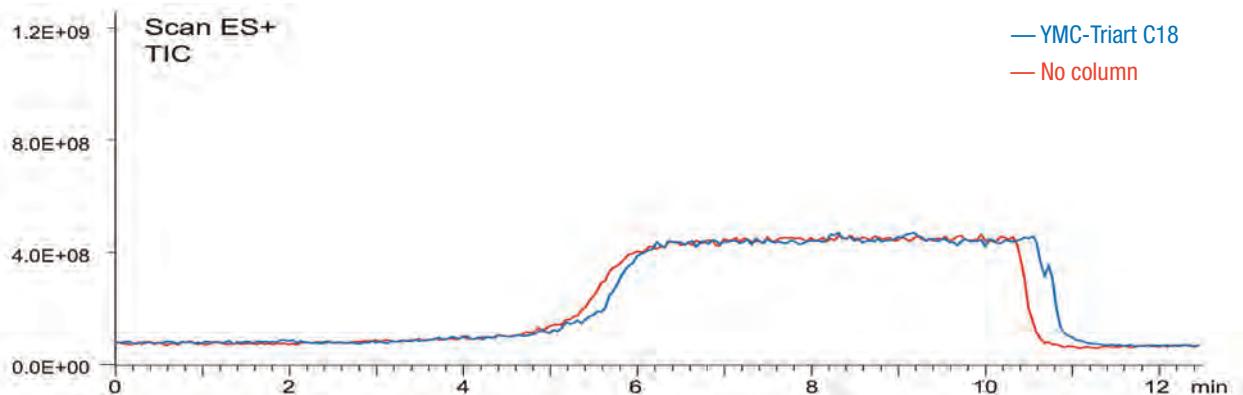

3. Stability test: pH 7.9, 70 °C

Column: YMC-Triart C18 (3 μ m, 12 nm)
 Part No.: 50 x 2.0 mm ID
 Eluent: TA12S03-0502WT
 20 mM KH₂PO₄-K₂HPO₄ / acetonitrile / methanol (40/45/15)
 Flow rate: 0.2 mL/min
 Detection: UV at 210 nm

LC / MS

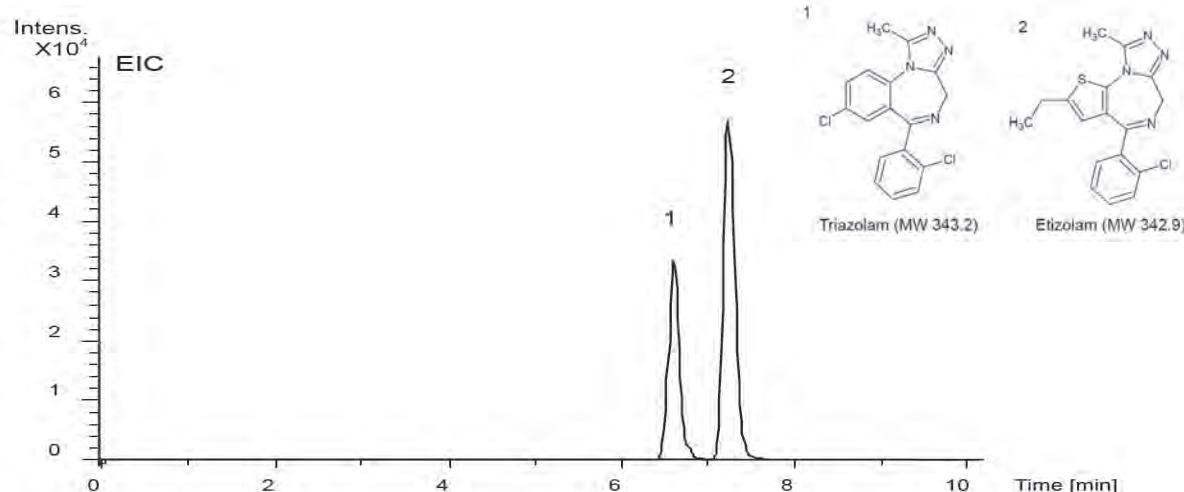

LC / MS compatibility

Column: 5 μ m, 50 x 2.0 mm ID
 Part-No.: TA12S05-0502WT
 Eluent:
 A) water + 0.1% formic acid
 B) acetonitrile + 0.1% formic acid
 Gradient: 5% B (0-1 min), 5-100% B (1-5 min),
 100% B (5-10 min), 100-5% B (10-10.1 min),
 5% B (10.1-12.5 min)
 Flow rate: 0.4 mL/min
 Temperature: 40 °C
 Detection: ESI positive, TIC (Mass Range: 50-1000)

Column bleeding, caused by the fragments of stationary phase, is the main reason for background noise and restrictions on detection limits. No bleed is observed in the test of total ion current (TIC) measured by LC/MS with blank or with YMC-Triart C18. So in terms of the signal/noise ratio (S/N ratio), YMC-Triart C18 can be expect to not only reduce the background noise but to also increase the sensitivity of the analysis.

LC / MS analysis of benzodiazepine derivates

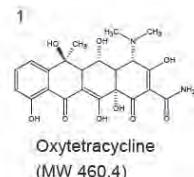

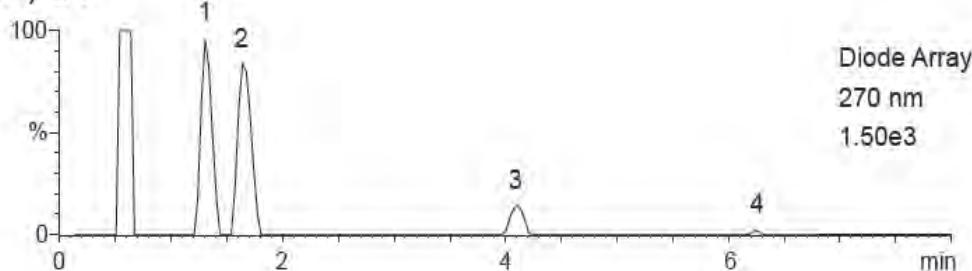

Column: YMC-Triart C18 (5 μ m, 12 nm) 50 x 2.0 mm ID
 Part-No.: TA12S05-0502WT
 Eluent:
 A) 10 mM formic acid
 B) acetonitrile
 Gradient: 25-50% B (0-10 min)
 Flow rate: 0.2 mL/min
 Temperature: 40 °C
 Detection: Bruker Daltonics microTOF, ESI,
 positive mode
 Injection: 5 μ L (100 ng/mL)

Part No.:	TA12S05-0502WT
Eluent:	acetonitrile / water / formic acid (15/85/0.1)
Flow rate:	0.4 mL/min
Temperature:	40 °C
Detection:	A) UV at 270 nm B) ESI positive-mode
Injection:	10 μL (1 $\mu\text{g}/\text{mL}$)

Highest resolution in UHPLC

Higher resolution and good loadability

Lower HETP means higher resolution!

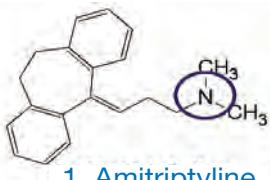

YMC-Triart C18 always shows the lowest HETP compared to the three Core-Shell products over the range of linear velocity applied.

 B) acetonitrile containing 10 mM formic acid
 Flow rate: 1.0 mL/min
 Temperature: 40 °C

Retention behavior of Duloxetine

Acetonitrile composition 0–30%:

Duloxetine does not elute due to the high hydrophobicity.

Acetonitrile composition 50–70%:

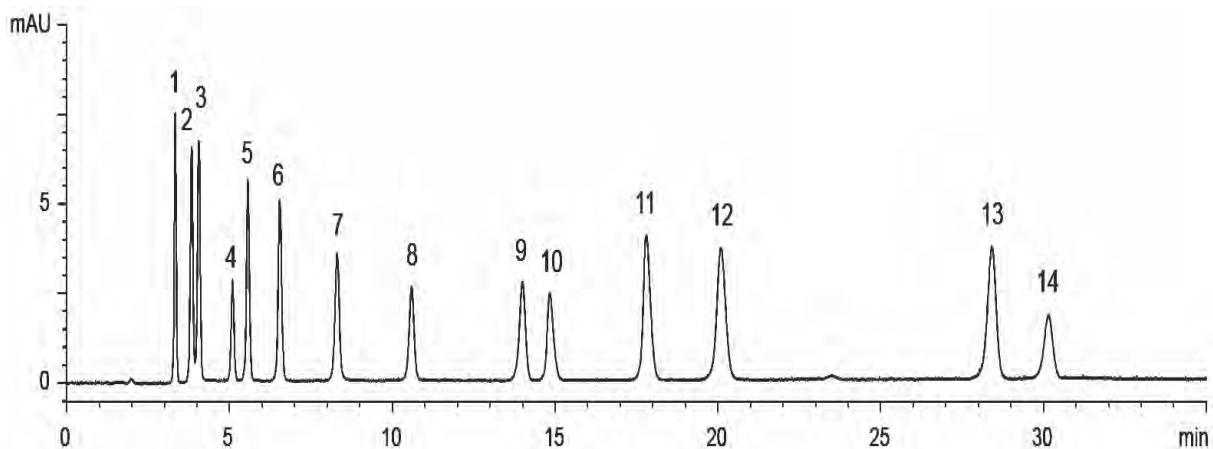

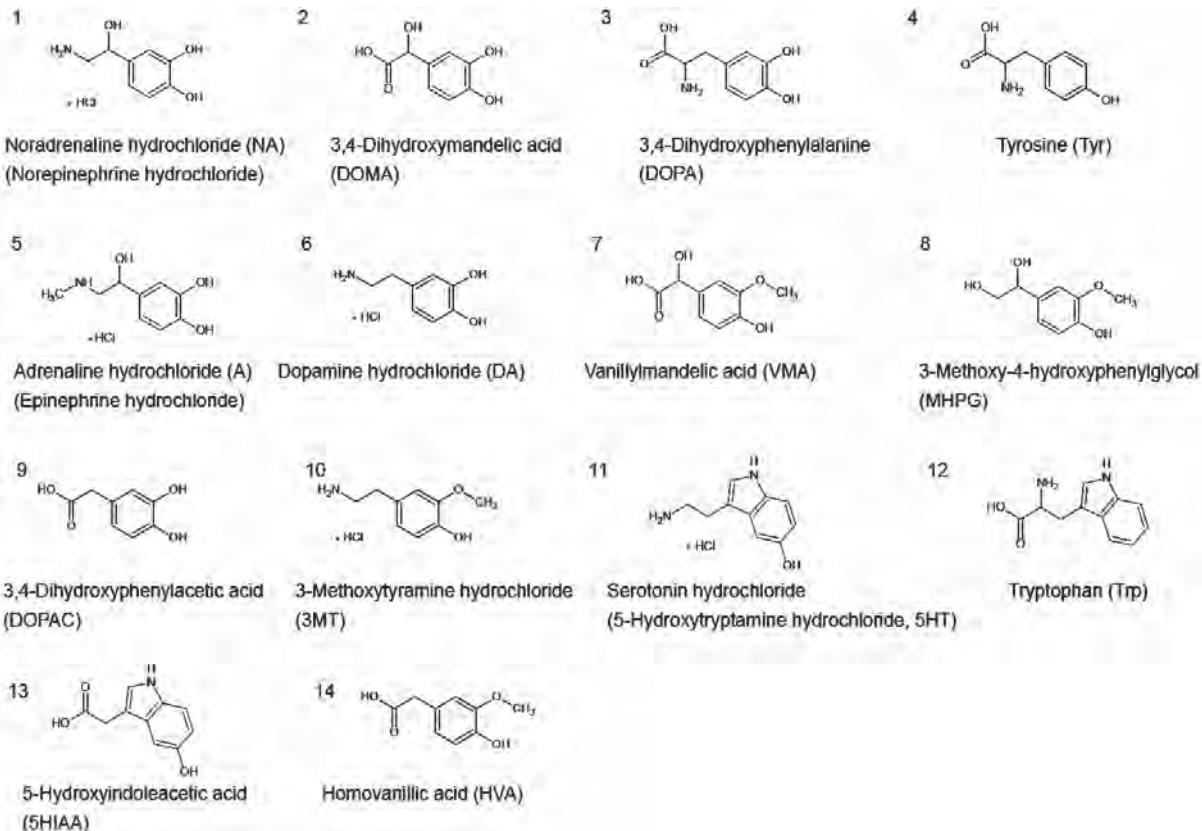

It can be eluted.

Acetonitrile composition 80–100%:

Retention becomes stronger, and elution does not take place at acetonitrile composition of 90% or higher.

Pharmaceuticals – YMC-Triart PFP

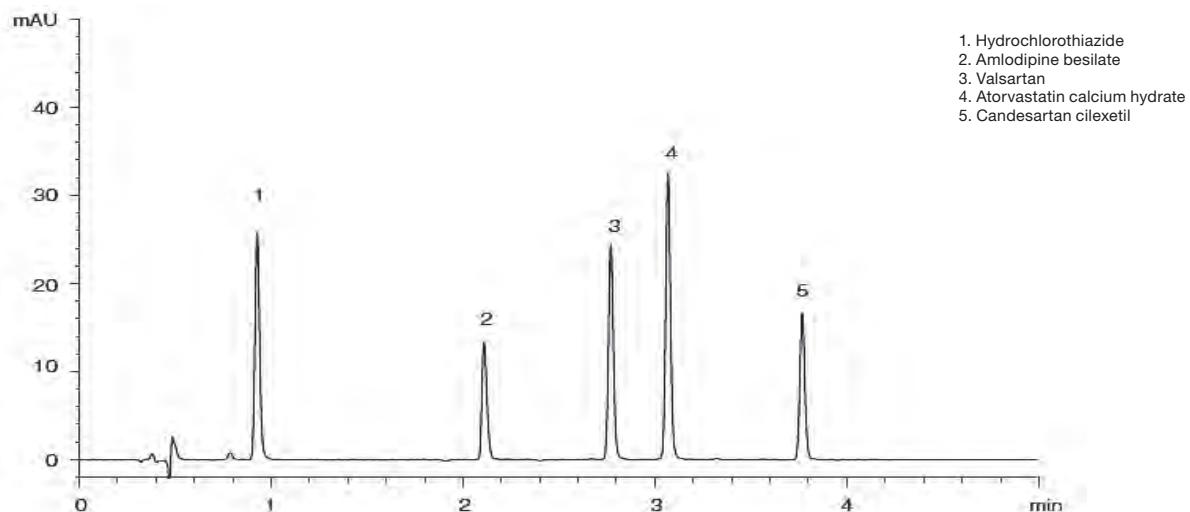

Catecholamines, serotonin, and their precursors and metabolites

YMC-Triart "AQ" | YMC-Triart C18

Problem with conventional C18 columns

Aqueous conditions deteriorate column performance

Why?

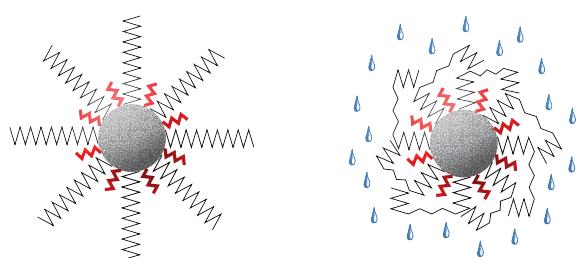

Image of C18 surface hydration

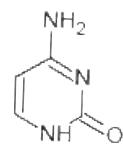

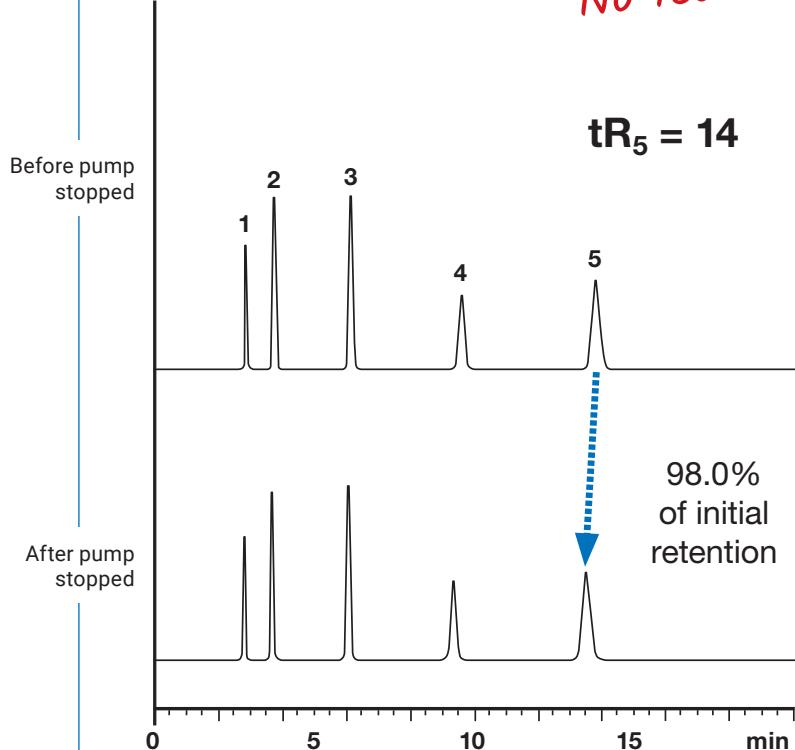

The columns used for applications involving 100% aqueous buffers provide shorter retention times after the flow was stopped between analyses. This behaviour is caused by poor hydration of the phase. Polar compounds cannot easily distribute between the mobile phase and the stationary phase.

YMC-Triart "AQ" | YMC-Triart C18

Image of C18 surface hydration

When YMC-Triart C18 columns are used for applications involving 100% aqueous buffers, the retention times are unchanged after the flow was stopped between analyses. This is due to the improved hydration of the phase. Polar compounds can easily distribute between the mobile phase and the stationary phase.

QC Data – Low back pressure

YMC-Triart: Improved quality of particles

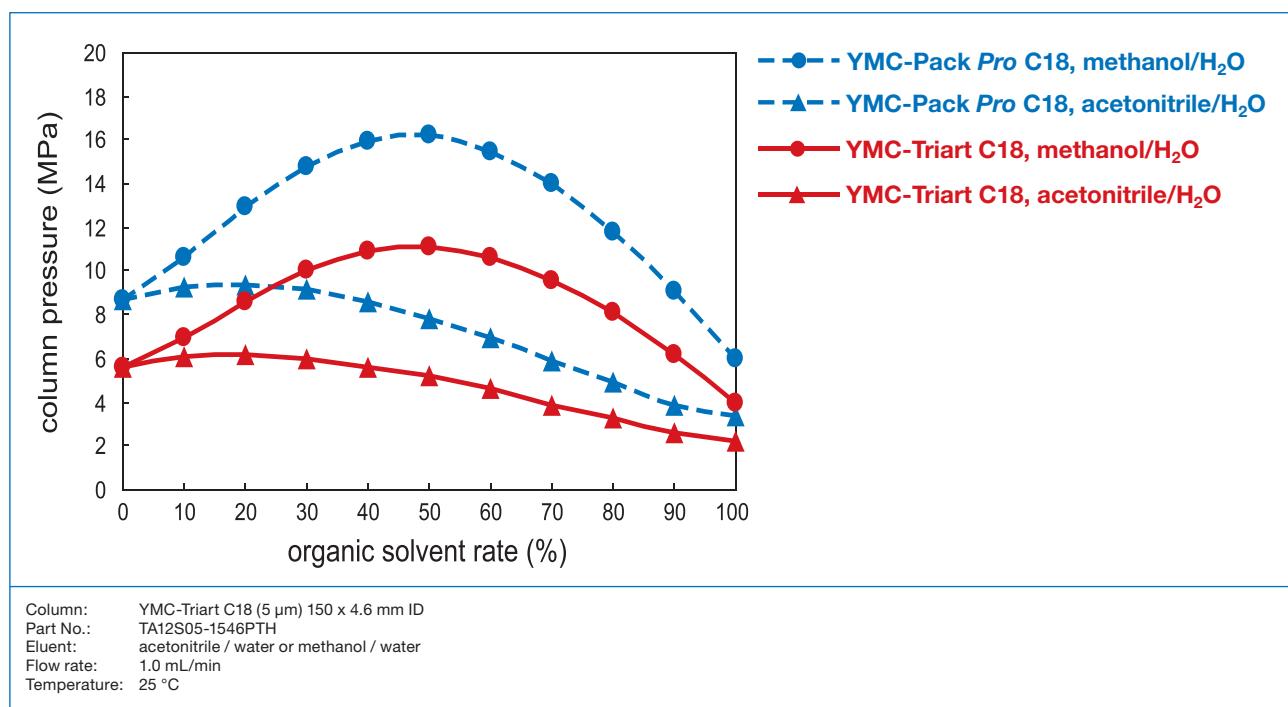

Uniform spherical particles

by courtesy of YMC Co., Ltd.

The uniform spherical particle support is used for all YMC-Triart phases. The particles are produced using micro-reactor technology for the granulation process. This results in reduction of the back-pressure and leads to more reproducibility in surface modification.

Low column back-pressure

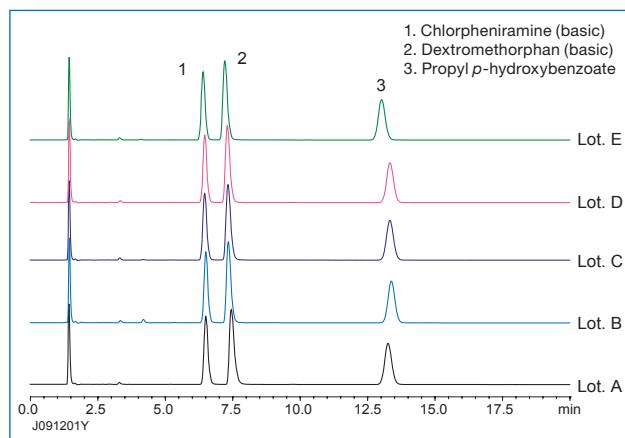

The revolutionary production technique, adapted from micro-reactor flow technology, produces a silica/organic hybrid stationary phase, with outstanding narrow pore size and particle size distributions which result in low back pressures. YMC-Triart is designed for use under a wide range of conditions. Elution with higher viscosity methanol (compared with acetonitrile), YMC-Triart generates lower pressure (approx. 30% lower than with conventional phases).

QC Data – Excellent reproducibility

Batch-to-batch reproducibility

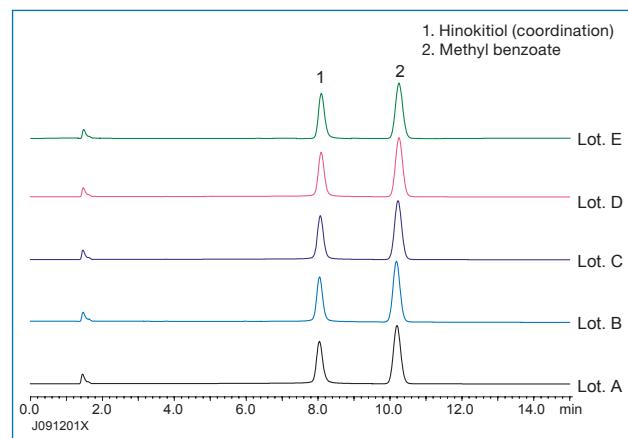

Excellent reproducibility of YMC-Triart phases is available even for the analysis of basic and coordination compounds which normally exhibit tailing and adsorption effects.

Column: YMC-Triart C18 (5 µm) 150 x 3.0 mm ID
 Part No.: TA12S05-1503PTH
 Eluent: 20 mM KH₂PO₄ (pH 6.9) / acetonitrile (65/35)

 Eluent: acetonitrile / 0.1% H₃PO₄ (40/60)
 Flow rate: 0.425 mL/min
 Temperature: 40 °C
 Detection: UV at 254 nm

The reproducibility of packed columns is shown below in terms of theoretical plate number (N) and tailing factor (Tf). YMC-Triart packed columns exhibit a very narrow range of variation.

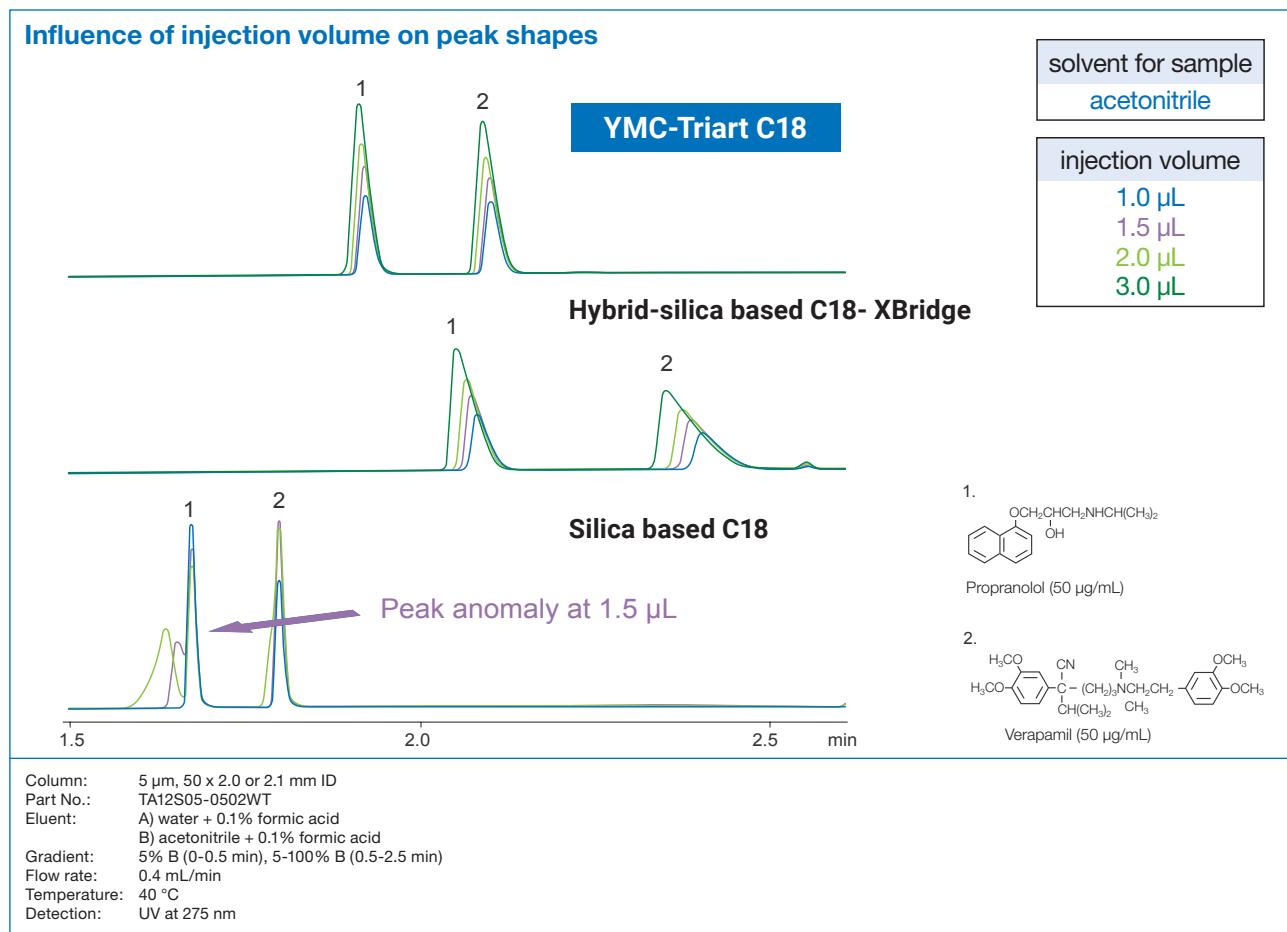

QC Data – High loadability

Narrow pore distribution

This figure shows the pore size distributions of some competitive material. Comparing the pore size distributions shows that YMC-Triart has a narrower distribution which results in sharper peak shapes.

Improved loadability

In order to prevent peak errors, there is a limit to the injection volume when a sample is injected in high elution solvents (such as 100% acetonitrile). Compared with traditional columns, more than double the injection volume can be injected into YMC-Triart columns as a result of the extremely narrow particle size distribution.

QC Data – Efficient endcapping

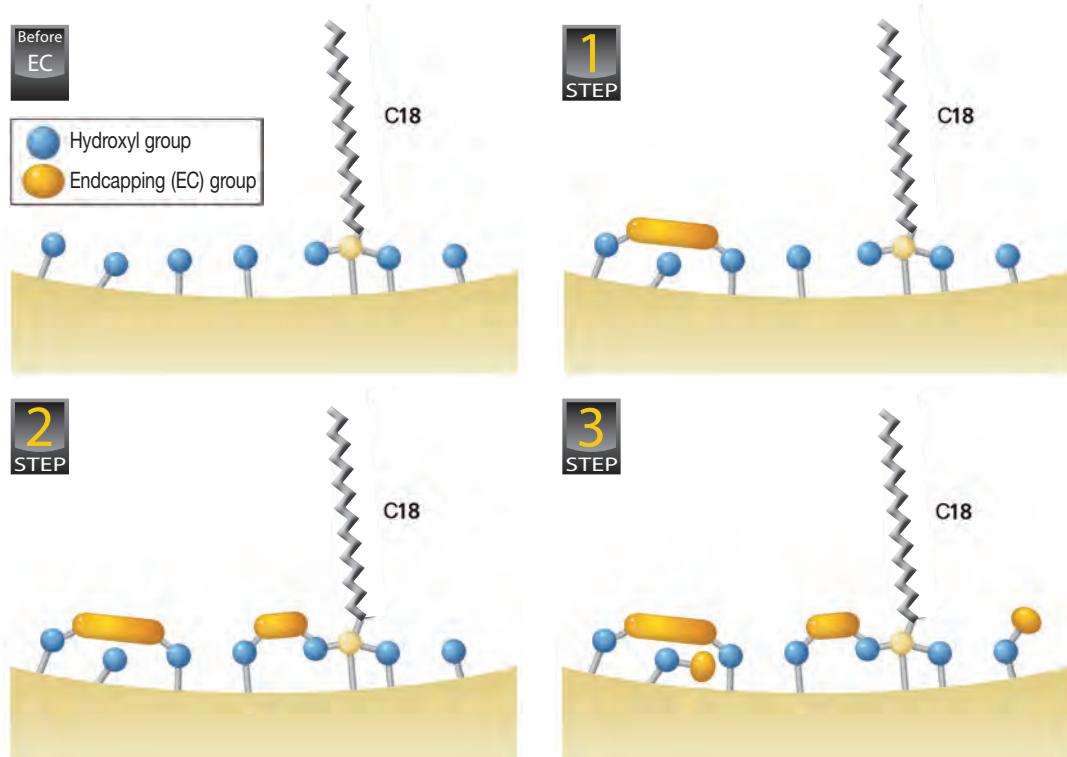

Multi-stage endcapping

After bonding the alkyl chain, there are highly reactive and less reactive silanols on the surface. In traditional bonding processes, these are reacted with a single endcapping-compound in one step.

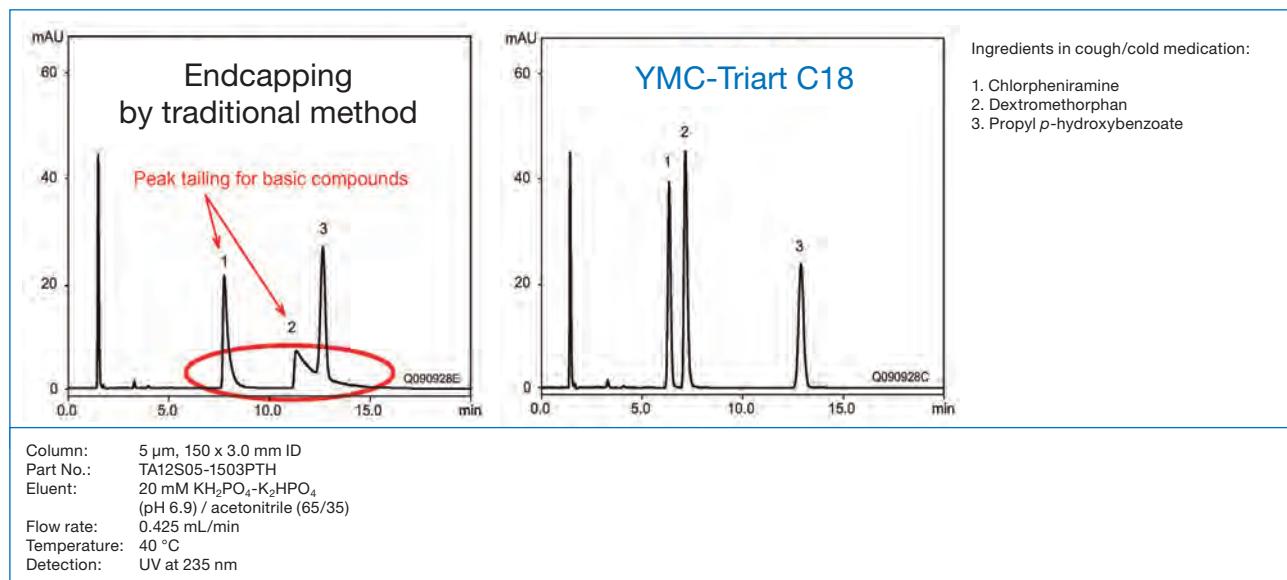

However, the highly reactive silanols can be hydrolysed easily which contributes to the poor stability. The less reactive silanols are hard to endcap which

results in poor resolution due to peak tailing. YMC-Triart phases use an innovation in endcapping called “multi-stage endcapping” for its surface modification process.

By using a number of compounds with different reactivities in successive steps, all silanols can be capped to the maximum extent.

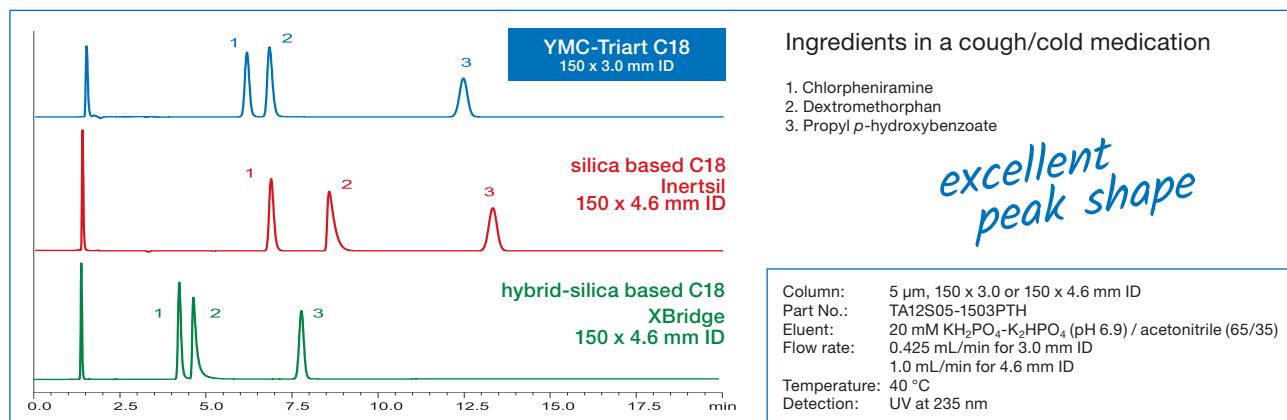

The chromatographic result of a “good” endcapping is demonstrated:

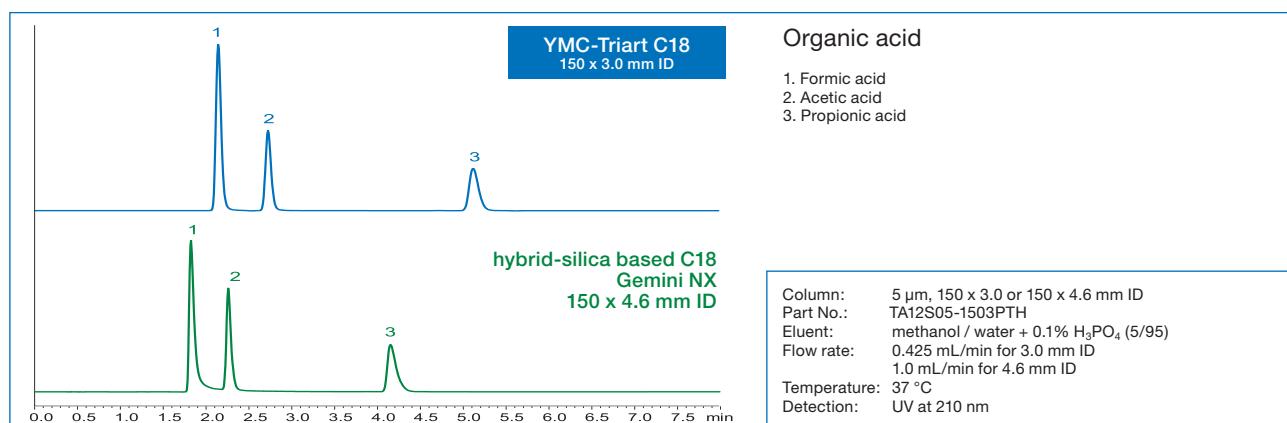

QC Data – Symmetric peaks

Basic compounds

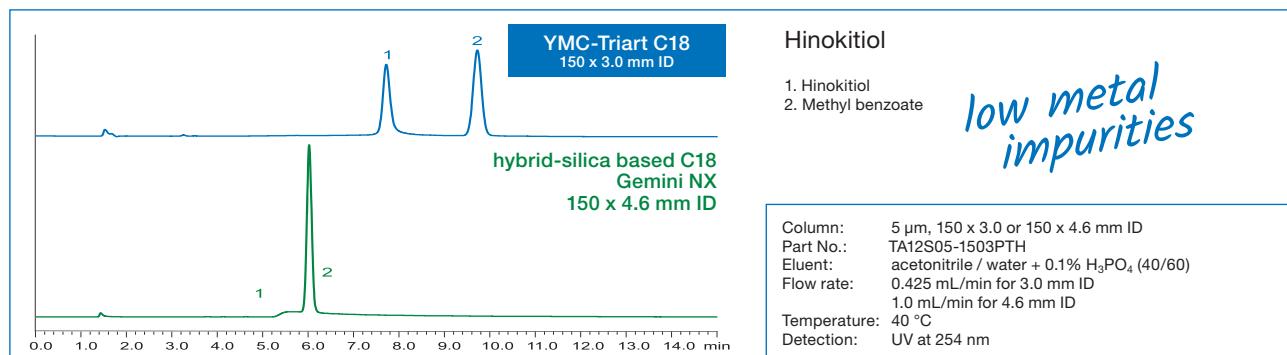

The innovative surface modification technology results in excellent peak shapes even for basic compounds that often exhibit peak tailing with conventional silica- and hybrid silica-based reversed phase columns.

Acidic compounds

YMC-Triart phases are synthesised using methodology adapted from micro-reactor technology. This technique ensures a reduction of impurities that contribute to peak tailing during the analysis of some types of acidic compounds.

Coordinating compounds

YMC-Triart phases have an extremely low level of metal impurities, much lower than conventional products, ensuring excellent peak shape for coordination compounds.

QC Data – Base deactivation

Comparison of clemastine analysis

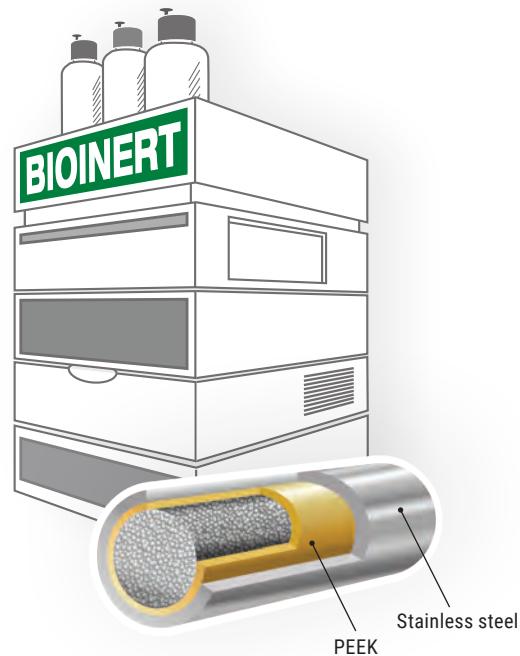

Clemastine is a well-known basic compound which readily exhibits peak tailing with conventional ODS columns. YMC-Triart C18 provides sharp separations with many different buffer/solvent compositions.

Metal coordinating compounds, which have a phosphate group in their structure, tend to show poor peak shape due to interactions with metals, such as the stainless steel in column bodies and frits. By using the metal-free column hardware, better peak shapes can

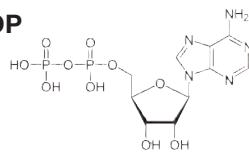

be expected. Nucleotides with phosphate groups also show better peak shapes when compared to the regular column hardware. The YMC-Triart metal-free column hardware is very suitable for highly sensitive analyses using LC/MS.

Column hardware for bioseparations and coordinating compounds

Improved LC/MS results

The YMC-Triart metal-free column showed excellent peak shapes when used to analyse fumonisins, while the regular column showed severe peak tailing due to interactions between the sample and the hardware. No carry over was observed when using the metal-free col-

umn, while the regular column showed sample carry over caused by adsorption of the sample on the hardware. The YMC-Triart metal-free column gives excellent peak shape for these coordination compounds and contributes to reliable analyses.

* YMC capillary columns are available with 1/16" (10-32 thread) or with 1/32" (6-40 thread) connections.

The connection size is indicated by the terminal letters of the order code:

1/16" fittings end with AU; 1/32" fittings end with RU. For ordering 1/32" connections, simply exchange AU by RU.

** no holder required, comes with a column coupler

* YMC capillary columns are available with 1/16" (10-32 thread) or with 1/32" (6-40 thread) connections.

The connection size is indicated by the terminal letters of the order code:

1/16" fittings end with AU; 1/32" fittings end with RU. For ordering 1/32" connections, simply exchange AU by RU.

** no holder required, comes with a column coupler

*YMC capillary columns are available with 1/16" (10-32 thread) or with 1/32" (6-40 thread) connections.

The connection size is indicated by the terminal letters of the order code:

1/16" fittings end with AU; 1/32" fittings end with RU. For ordering 1/32" connections, simply exchange AU by RU.

** no holder required, comes with a column coupler
