## First choice column for method development

Conventional hybrid silica-based ODS columns tend to be less hydrophobic than silica-based columns. YMC-Triart C18 has a higher carbon load, giving it a hydrophobicity comparable to that of standard ODS columns, thereby making it a "versatile first-choice" column for method development. Whereas YMC-Triart C18 ExRS is designed to provide contrastive separation characteristics!

Chromatographers always seek to push the limits of HPLC columns to greater extremes to allow them to perform day-to-day with ever-changing pH, buffers and temperature ranges. The column for the laboratory of today must be suitable for harsh pH conditions in combination with high temperature ranges without sacrificing selectivity. In addition narrow, symmetrical peak shapes are necessary in order to cope with rapid analysis of demanding samples. This has required manufacturers to seek more innovative ways to produce suitable stationary phases.

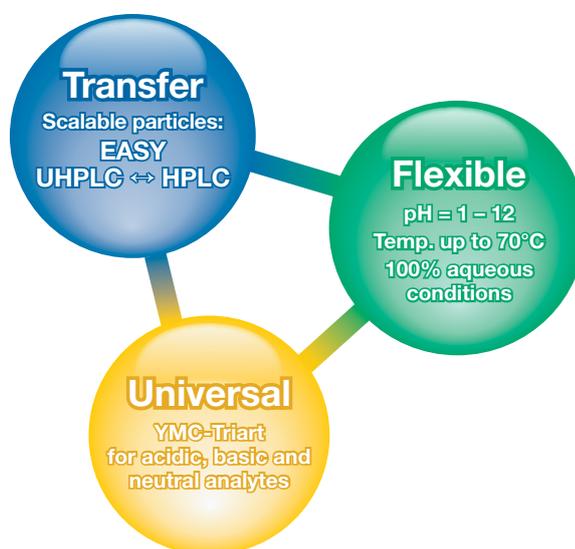

In order to meet these goals, YMC has developed a new particle technology. This is based on a multi-layered particle produced via a tightly controlled granulation technology which has been adapted from micro-reactor technology. The revolutionary production technique provides a multi-layer silica-organic hybrid stationary phase, which provides an outstandingly narrow pore size and particle size distribution. This in turn, results in low back pressures and high loadability.

## Particle technology

YMC-Triart is a versatile material prepared using tightly controlled particle formation technology which has been adapted from micro-reactor technology. This recently developed production process results in exceptionally narrow particle and pore size distributions.

With YMC-Triart, challenging pH and high temperature conditions are no longer a limitation to the day-to-day work in laboratories. Most importantly, due to its unique particle composition, a balanced hydrophobicity and silanol activity are achieved which makes YMC-Triart a "First Choice" column in method development.

## Versatile wide pH stability

### Phosphate buffer (pH 11.5, 40 °C)

Column: 5 µm, 150 x 4.6 mm ID  
 Part-No.: TA12S05-1546WT  
 Eluent: 50 mM  $K_2HPO_4$ - $K_3PO_4$  (pH 11.5) / methanol (90/10)  
 Flow rate: 1.0 ml/min  
 Sample: benzyl alcohol

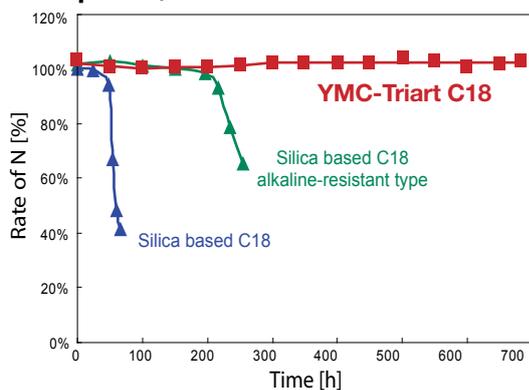

### Triethylamine (pH 11.5, 40 °C)

Column: 5 µm, 150 x 4.6 mm ID  
 Part-No.: TA12S05-1546WT  
 Eluent: 50 mM triethylamine (pH 11.5) / methanol (90/10)  
 Flow rate: 1.0 ml/min  
 Sample: benzyl alcohol

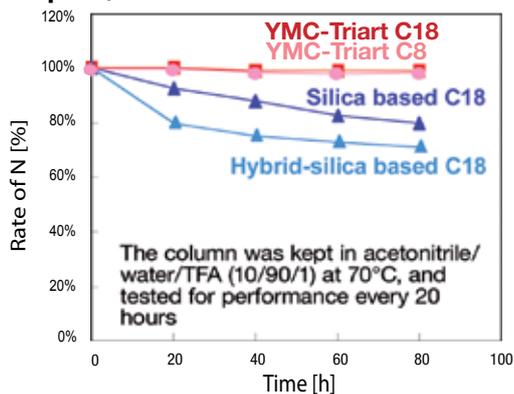

## Stability at high temperature

### pH 6.9, 70 °C

Column: 5 µm, 50 x 2.0 mm ID  
 Part-No.: TA12S05-0502WT  
 Eluent: 20 mM  $KH_2PO_4$ - $K_2HPO_4$  (pH 6.9) / acetonitrile (90/10)  
 Flow rate: 0.2 ml/min  
 Temperature: 70 °C  
 Sample: phenol

### pH 1, 70 °C

Column: 5 µm, 50 x 2.0 mm ID  
 Part-No.: TA12S05-0502WT  
 Eluent: acetonitrile / water (60/40)  
 Flow rate: 0.2 ml/min  
 Temperature: 70 °C  
 Sample: butyl benzoate

YMC-Triart phases show great chemical stability due to the newly developed hybrid-silica. Even under high pH or high temperature conditions, the lifetime of YMC-Triart phases is more than 10x greater than conventional reversed phase columns.

## Secure your method transfer!

Differences in selectivity, retention time, and also peak shapes between different particle sizes of commercially available C18 phases in the same brand (or an alternative as recommended by its manufacture) have been observed.

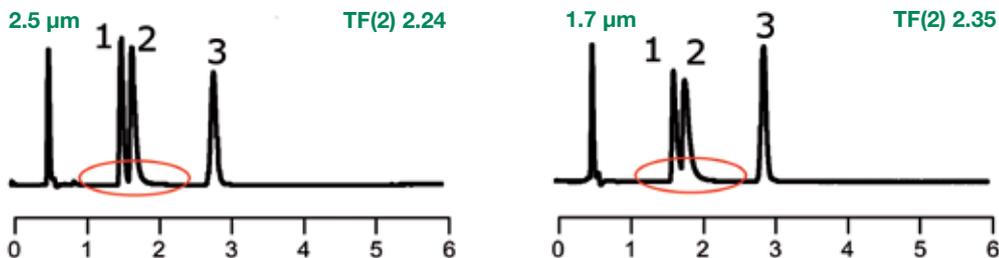

### YMC-Triart C18

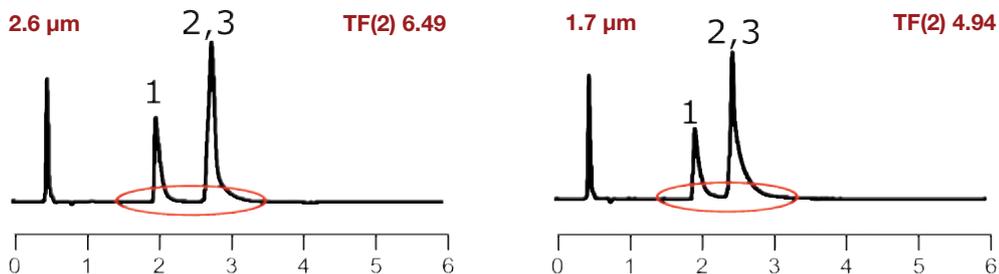

YMC has addressed this issue of method transfer. YMC-Triart columns show identical selectivity and excellent peak shapes for basic compounds for all 3.0 µm to 1.9 µm particle sizes. It allows predictable scale up from UHPLC to conventional HPLC and even to semi-preparative LC, and vice versa.

### Case Studies\*

Flow rate: 0.2 ml/min  
Detection: UV at 235 nm

1. Chlorpheniramine (basic)  
2. Dextromethorphan (basic)  
3. Propyl paraben (internal standard)

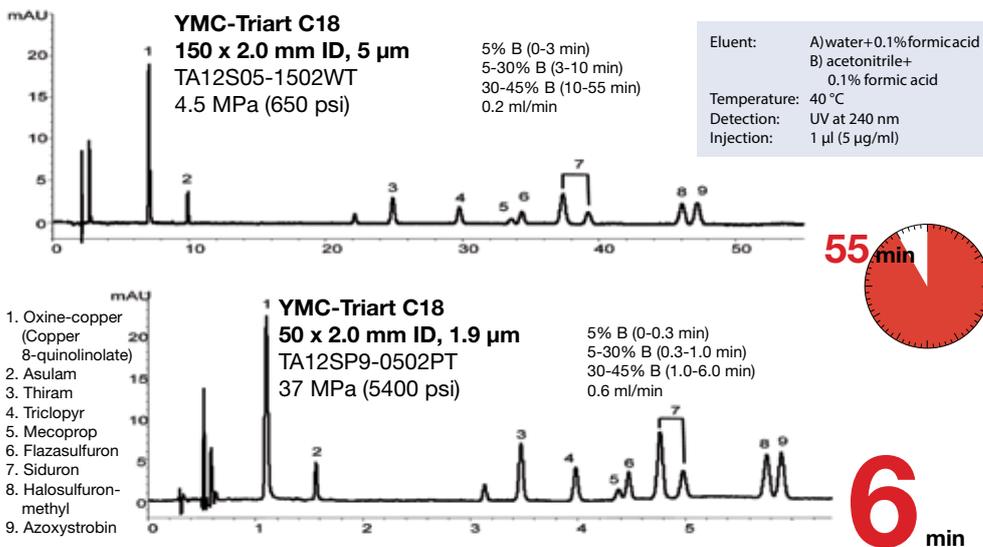

\* There observations might not be representative for all applications but have been reported in some cases.

## Evaluation of method transfer performance!

With the introduction of UHPLC, sub-2- $\mu$ m particles became necessary. Therefore smaller particles have been added to existing column lines. Consequently, sub-2- $\mu$ m particles may exhibit differences in chromatographic performance. By introducing YMC-Triart, YMC provides matching chromatographic behaviour for **all** particles sizes!

**Flow rate:** 0.4 ml/min  
**Temperature:** 40 °C  
**Detection:** ESI positive, TIC (Mass Range: 50-1000)

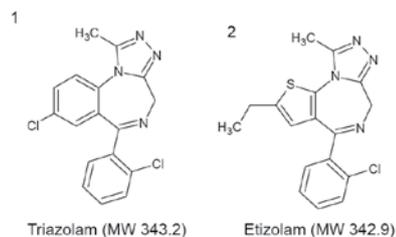

Column bleeding, caused by the fragments of stationary phase, is the main reason for background noise and restrictions on detection limits. No bleed is observed in the test of total ion current (TIC) measured by LC/MS with blank or with YMC-Triart C18. So in terms of the signal/noise ratio (S/N ratio), YMC-Triart C18 can be expected to not only reduce the background noise but to also increase the sensitivity of the analysis.

## Great stability and reproducibility at high pH

### Stability in high pH (pH 11, 50 °C)

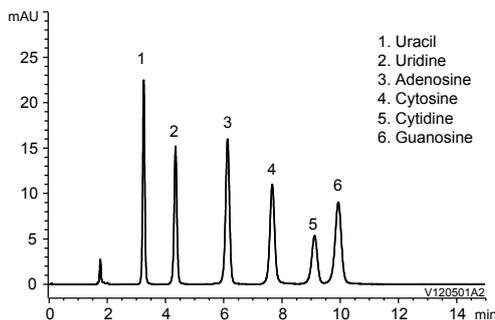

Column: 5  $\mu$ m, 150 x 4.6 mm ID  
 Part-No.: TDH12S05-1546WT

 Detection: UV at 235 nm  
 Injection: 2  $\mu$ l (10  $\mu$ g/ml)

## Polar and hydrophilic compounds

Triart C18 (RP) shows very weak retention and poor resolution of L-ascorbic acid and its stereoisomer (erythorbic acid) even if 100% aqueous mobile phase is used. However, Triart Diol-HILIC shows strong retention and good resolution of these compounds with mobile phase containing 90% organic solvent.

## YMC-Triart: Improved quality of particles

### Uniform spherical particles

YMC-Triart

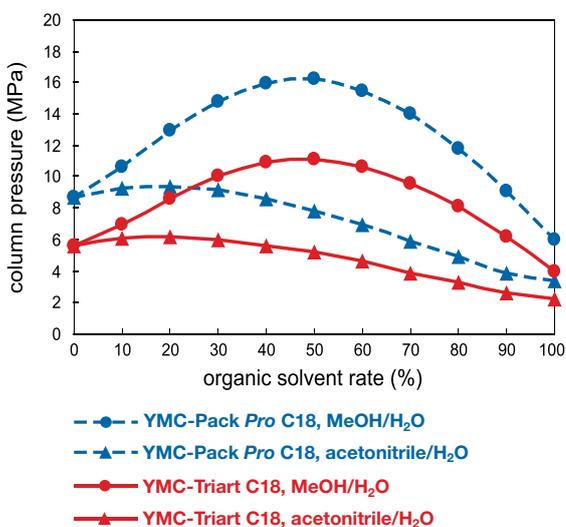

X-Bridge HILIC

The new uniform spherical particle support is used for YMC-Triart C18 and C8. The particle is produced using **micro-reactor** technology for the granulation process. This results in reduction of the back pressure and leads to more reproducibility in surface modification.

### Low column back pressure

Column: YMC-Triart C18, 5 μm, 150 x 4.6 mm ID  
 Part-No.: TA12S05-1546WT  
 Eluent: acetonitrile / water or methanol / water  
 Flow rate: 1.0 ml/min  
 Temperature: 25 °C

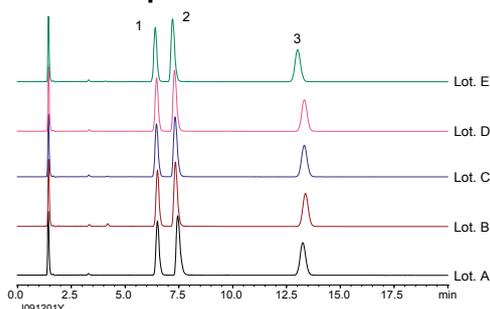

The revolutionary production technique, adapted from micro-reactor flow technology, produces a multi-layered silica/organic hybrid stationary phase with outstanding narrow pore size and particle size distributions, which results in low back pressures.

YMC-Triart is designed for use under a wide range of conditions. Elution with higher viscosity methanol (compared with acetonitrile), YMC-Triart generates lower pressure (approx 30% lower than with conventional phases).

## Batch-to-Batch reproducibility

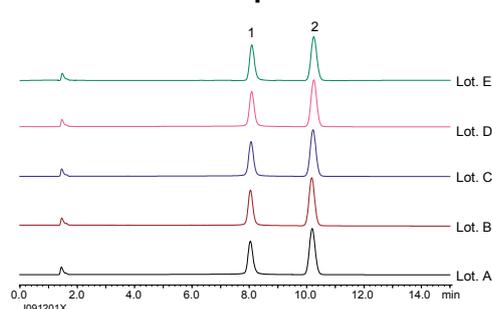

Excellent reproducibility of YMC-Triart phases is available even for the analysis for basic and coordination compounds which normally exhibit tailing and adsorption effects.

### Basic compounds

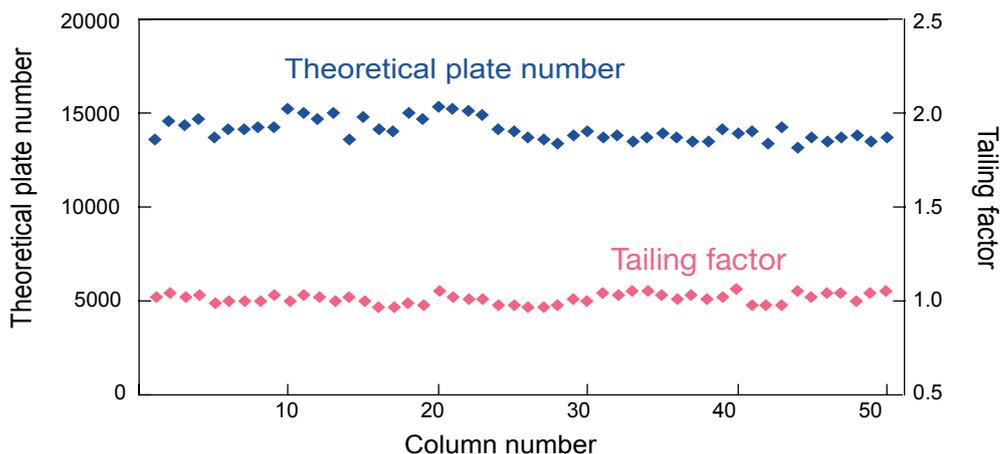

Column: YMC-Triart C18, 5  $\mu\text{m}$ , 150 x 3.0 mm ID  
 Part-No.: TA12505-1503WT  
 Eluent: 20 mM  $\text{KH}_2\text{PO}_4$  (pH 6.9) / acetonitrile (65/35)  
 Flow rate: 0.425 ml/min  
 Temperature: 40  $^\circ\text{C}$   
 Detection: UV at 235 nm

### Coordination compounds

Column: YMC-Triart C18, 5  $\mu\text{m}$ , 150 x 3.0 mm ID  
 Part-No.: TA12505-1503WT  
 Eluent: acetonitrile / 0.1%  $\text{H}_3\text{PO}_4$  (40/60)  
 Flow rate: 0.425 ml/min  
 Temperature: 40  $^\circ\text{C}$   
 Detection: UV at 254 nm

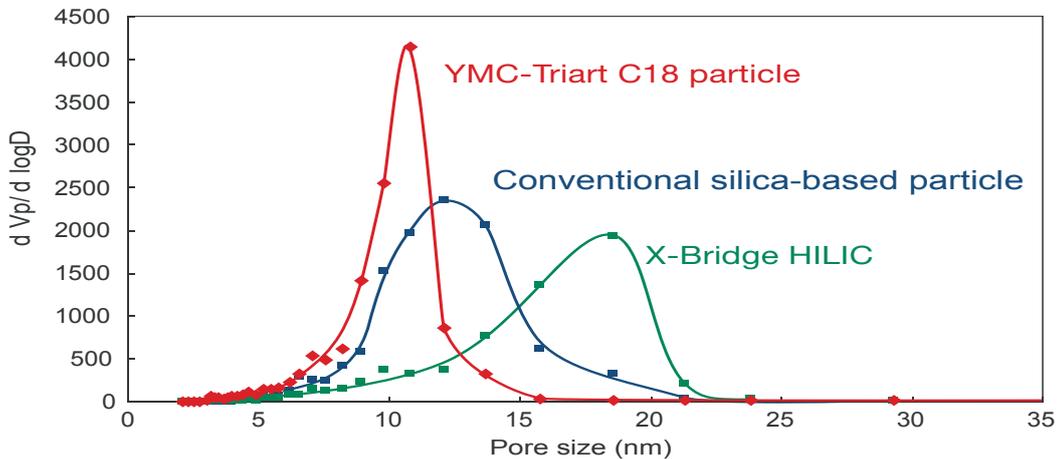

The reproducibility of packed columns is shown below in terms of theoretical plate number (N) and tailing factor (Tf). YMC-Triart packed columns exhibit a very narrow range of variation.

Column: YMC-Triart C18, 5  $\mu\text{m}$ , 150 x 4.6 mm ID  
 Part-No.: TA12505-1546WT  
 Eluent: acetonitrile / water (40/60)  
 Flow rate: 1.0 ml/min  
 Temperature: ambient  
 Sample: butyl benzoate

## Narrow pore distribution

This figure shows the pore size distributions of some competitive materials. Comparing the pore size distributions of some competitive materials shows that YMC-Triart has a narrower distribution which results in sharper peak shapes.

## Improved loadability

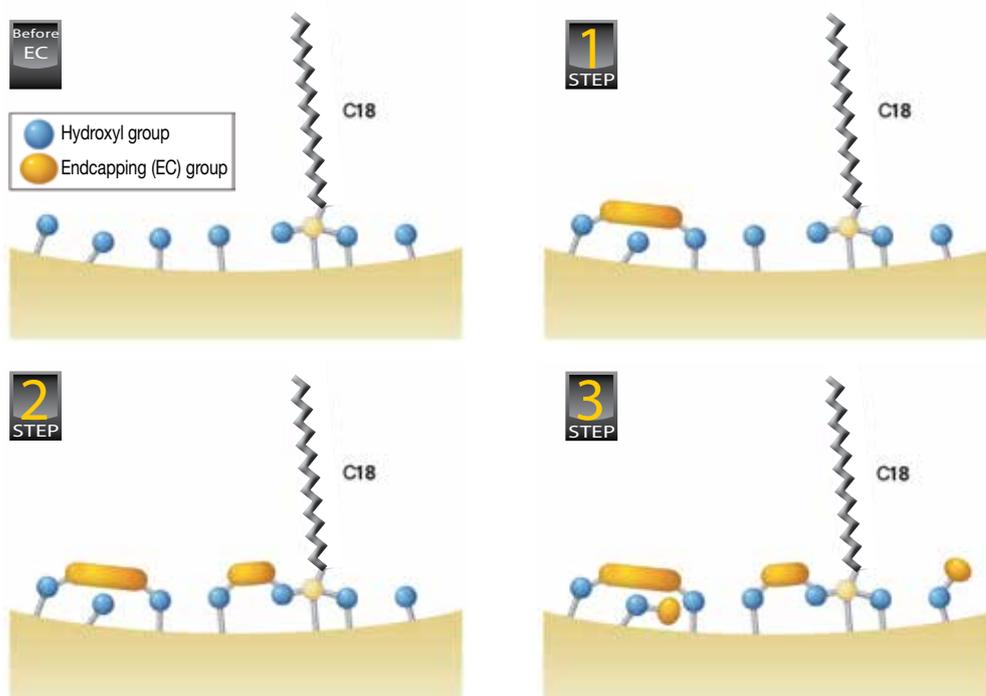

In order to prevent peak errors, there is the limit to the injection volume when the sample is injected in high elution solvents (such as 100% acetonitrile). Compared with traditional columns, more than double the injection volume can be injected into YMC-Triart columns as a result of the extremely narrow particle size distribution.

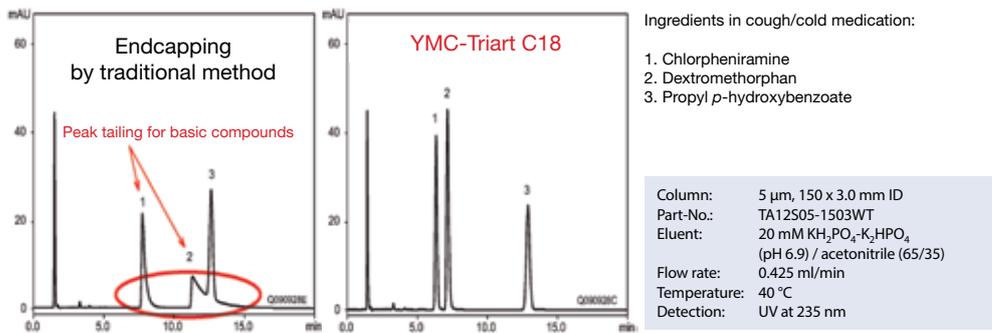

## Multi-stage endcapping

After bonding the alkyl chain, there are highly reactive and less reactive silanols on the surface. In traditional bonding processes, these are reacted with a single capping-compound in one step. However, the highly reactive silanols can be hydrolysed easily which contributes to the poor stability. The less reactive silanols are hard to endcap which results in poor resolution due to peak tailing.

YMC-Triart C18, C8 and Phenyl phases use a new innovation in endcapping called "multi-stage endcapping" for its surface modification process. By using a number of compounds with the different reactivities in successive steps, all silanols can be capped to the maximum extent.

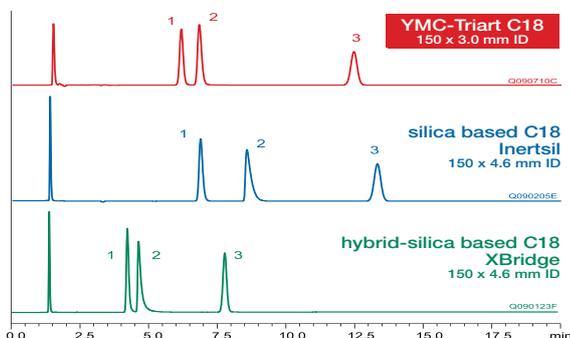

The chromatographic result of a "good" endcapping is demonstrated:

## Basic compounds

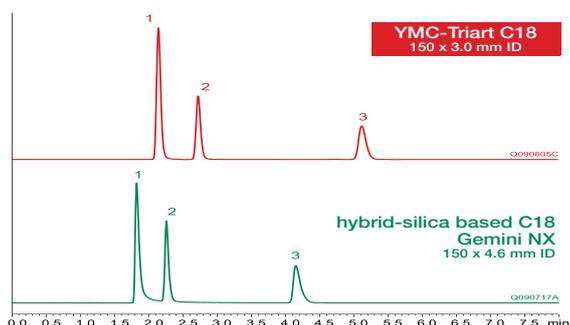

### Ingredients in a cough/cold medication

1. Chlorpheniramine
2. Dextromethorphan
3. Propyl p-hydroxybenzoate

Column: 5  $\mu$ m, 150 x 3.0 or 150 x 4.6 mm ID  
 Eluent: 20 mM  $\text{KH}_2\text{PO}_4$ - $\text{K}_2\text{HPO}_4$  (pH 6.9) / acetonitrile (65/35)  
 Flow rate: 0.425 ml/min for 3.0 mm ID  
 1.0 ml/min for 4.6 mm ID  
 Temperature: 40 °C  
 Detection: UV at 235 nm

The innovative surface modification technology results in excellent peak shapes even for basic compounds that often exhibit peak tailing with conventional silica- and hybrid silica-based reversed phase columns.

## Acidic compounds

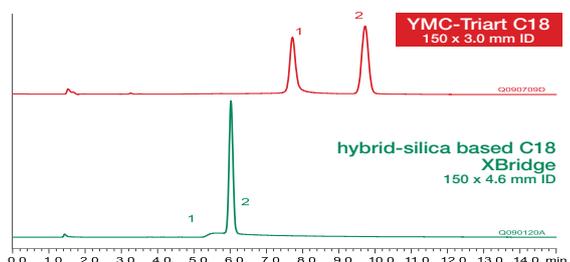

### Organic acid

1. Formic acid
2. Acetic acid
3. Propionic acid

Column: 5  $\mu$ m, 150 x 3.0 or 150 x 4.6 mm ID  
 Eluent: methanol / water + 0.1%  $\text{H}_3\text{PO}_4$  (5/95)  
 Flow rate: 0.425 ml/min for 3.0 mm ID  
 1.0 ml/min for 4.6 mm ID  
 Temperature: 37 °C  
 Detection: UV at 210 nm

YMC-Triart phases is synthesised using methodology adapted from micro-reactor technology. This technique ensures a reduction of impurities that contribute to peak tailing during the analysis of some types acidic compounds.

## Coordinating compounds

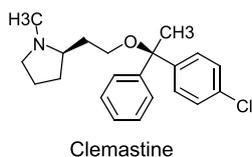

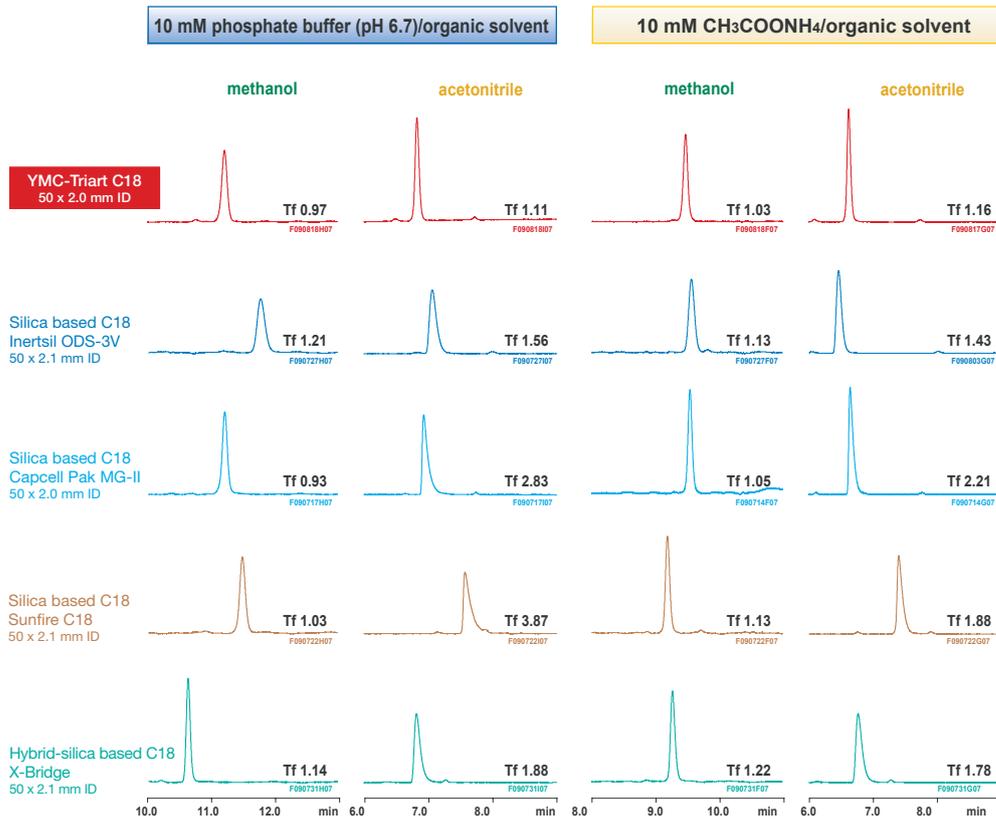

### Hinokitiol

1. Hinokitiol
2. Methyl benzoate

Column: 5  $\mu$ m, 150 x 3.0 or 150 x 4.6 mm ID  
 Eluent: acetonitrile / water + 0.1%  $\text{H}_3\text{PO}_4$  (40/60)  
 Flow rate: 0.425 ml/min for 3.0 mm ID  
 1.0 ml/min for 4.6 mm ID  
 Temperature: 40 °C  
 Detection: UV at 254 nm

YMC-Triart phases have an extremely low level of metal impurities, much lower than conventional products, ensuring excellent peak shape for coordination compounds.

## Comparison of clemastine analysis

Column: 5  $\mu$ m, 50 x 2.0 or 50 x 2.1 mm ID  
 Eluent: A) 10 mM KH<sub>2</sub>PO<sub>4</sub>-K<sub>2</sub>HPO<sub>4</sub> (pH 6.7) or 10 mM CH<sub>3</sub>COONH<sub>4</sub>  
 B) methanol or acetonitrile  
 5-90% B (0-10 min), 90% B (10-15 min)  
 Flow rate: 0.2 ml/min  
 Temperature: 25 °C  
 Detection: UV at 230 nm

Clemastine is a well-known basic compound which readily exhibits peak tailing with conventional ODS columns. YMC-Triart C18 provides sharp separations with many different buffer/solvent compositions.
